VEDANSH PAUNIKAR

DevOps Engineer

vedanshpaunikar25@gmail.com +91 8668475797 Pune, India LinkedIn GitHub

Portfolio

Summary

Results-driven DevOps and Cloud Engineer with 2+ years of experience in cloud infrastructure management, CI/CD pipeline automation, application deployment, and infrastructure monitoring. Skilled in AWS, Microsoft Azure, Docker, Kubernetes, Terraform, Jenkins, GitHub Actions, and Linux. Experienced in Infrastructure as Code (IaC), container orchestration, deployment automation, cloud resource management, and monitoring using Prometheus, Grafana, and CloudWatch. Focused on deployment efficiency, reliability, scalability, automation and DevOps best practices.

Experience

DevOps Engineer, *Hisan Labs Private Limited* 11/2024 – Present
Pune

- Provisioned and maintained AWS infrastructure using EC2, VPC, IAM, S3, RDS, ALB, Route 53, and CloudWatch for secure and scalable application hosting.
- Deployed containerized applications on Docker, Kubernetes, and Amazon EKS, managing workloads, rolling updates, services, health checks, and resource allocation.
- Created reusable Terraform configurations to automate AWS provisioning, maintain Infrastructure as Code, and ensure consistent environments.
- Automated application builds and deployments using Jenkins and GitHub Actions, improving release consistency and reducing manual effort through CI/CD pipelines.
- Monitored infrastructure and application performance using Prometheus, Grafana, Datadog, and CloudWatch to identify issues and support troubleshooting.
- Supported cloud Cost Optimization by reviewing resource utilization, identifying underused AWS resources, and recommending right-sizing and efficient resource allocation to reduce unnecessary infrastructure costs.
- Collaborated with development teams on application configuration, environment setup, release execution, and deployment validation.
- Configured AWS IAM roles, policies, and permissions to strengthen access control and protect cloud resources.
- Developed Bash and Python scripts for operational automation, log analysis, and routine system administration tasks.
- Supported Azure migration activities by validating application functionality, network connectivity, permissions, and compute and storage resources.
- Used ELK Stack, Prometheus, and Grafana for log analysis, metrics visualization, and improved operational visibility.
- Supported application availability through load balancer configuration, Kubernetes rolling updates, health checks, and post-deployment validation.

Education

Bachelor of Computer Applications (BCA), *Tilak Maharashtra Vidyapeeth* 05/2022 – 05/2025
CGPA: 8.89/10 Pune

Technical Skills

Cloud
AWS, Azure, GCP, EKS, ECS, ECR, IAM, S3, RDS

Containers
Kubernetes, Docker, Helm

Infrastructure as Code
Terraform, AWS CloudFormation, Ansible

CI/CD
Jenkins, GitHub Actions, GitLab CI/CD

Observability
Prometheus, Grafana, CloudWatch

Programming
Python, Bash

Operating Systems
Linux, Windows

Version Control
Git, GitHub, GitLab

Databases
MySQL, DynamoDB

Networking
TCP/IP, DNS, HTTP/HTTPS, SSL/TLS, Load Balancing

DevOps Projects

Medical B2B ERP System
Technologies: AWS, EKS, Docker, Kubernetes, Terraform, Jenkins, React, MongoDB

- Developed and containerized three Spring Boot microservices using Docker, preparing application components for deployment in a Kubernetes environment.
- Deployed microservices on Amazon EKS and configured Kubernetes Deployments, Services, ConfigMaps, Secrets, and rolling updates to manage application workloads.
- Automated AWS infrastructure provisioning with Terraform, defining resources and configurations for repeatable environment setup and simplified infrastructure management.
- Configured Jenkins CI/CD workflows to automate application build, Docker image creation, and deployment to the Kubernetes environment.
- Set up application traffic routing through Kubernetes Services and AWS Application Load Balancer to enable external access to deployed services.
- Integrated AWS infrastructure components, including EKS, S3, CloudFront, and Route 53, to support application hosting and access where required.
- Troubleshot container startup failures, Kubernetes workload issues, service connectivity, and deployment configuration problems.

Containerized Microservice Application Platform
Technologies: AWS, Docker, Kubernetes, Terraform, Jenkins, React, MongoDB

- Designed and deployed a three-tier web application consisting of a React frontend, Node.js backend, and MySQL database using Docker Compose.
- Created Docker configurations for each application layer and organized services using separate Docker networks to manage inter-container communication.
- Configured persistent Docker volumes for MySQL to preserve database data across container restarts and application redeployments.
- Connected backend REST APIs to MySQL using environment-based configuration, avoiding hardcoded database connection details in application code.
- Managed source code and configuration changes through Git and GitHub, using version control and organized development workflows.
- Deployed the application on an Ubuntu 22.04 Linux server and configured environment variables, firewall rules, and application connectivity.
- Troubleshot container startup problems, database connectivity, network configuration, and application deployment issues across the three-tier architecture.

Certificates

- Cloud DevOps Engineering Course with AI (CDEC)
- AWS Certified Solutions Architect – Associate (SAA-C03)
